Learning objectives of the subject:

Custom smart adaptive systems, as part of the well known "Intelligent system" approach, will permit to understand the different stages that constitute an electronic system able to gather an integrate raw data coming from a large number of sensing sources and integrate them into a high-level decision taking infrastructure. The methods presented provide the adaptive features that will permit the system to operate under changing or unknown conditions, or even in the presence of faults, by configuring autonomously its parameters or structure. Another major goal will consist in choosing the efficient implementation of the final system taking into account relevant features such as memory capacity and bandwidth, throughput and power consumption. Intelligent methodologies for the treatment of gathered data will be considered as part of the necessary step the for "automatic knowledge extraction" from data. The subject will present the principles of the respective parts, with a project integrating the whole chain for a given application.

Learning results of the subject:

||
- Ability to understand and differentiate the main building blocks constituting a smart adaptive system.
- Ability to apply feature extraction and selection as well as data fusion techniques in order to facilitate the implementation of decision tasks.
- Ability to analyse and implement adaptive methods able to solve signal processing tasks.
- Ability to choose a correct implementation alternative for an adaptive system, taking into account system constraints such as memory bandwidth and capacity, throughput and power consumption.
- Ability to develop techniques for the design, analysis and evaluation of electronic systems in applications such as automation, aerospace, energy distribution and generation, consumer electronics, biomedicine, etc.
- Ability to synthesize and solve problems related to the electronic engineering discipline, to apply learning techniques in complex and multiple contexts, to apply previous knowledge to new situations and contexts, as well as the ability to coordinate and work in a team.
- Ability to design electronic systems able to integrate raw data coming from sensors and construct a high-level decision infrastructure.

5. Implementation principles

Learning time: 26h
- Theory classes: 4h
- Laboratory classes: 4h
- Self study: 18h

Description:
- Implementation alternatives
- Memory bandwidth and capacity
- System throughput
- Power consumption

Planning of activities

LABORATORY

Description:
- Presentation of case studies.
- Artificial Neural Networks.
- Bio-inspired electronic systems

ORAL PRESENTATION

Description:
- Presentation of a work group.

Qualification system

Self-study group assessments: 50%
Laboratory assessments: 30%
Personal project: 20%
